Prove the Gate: Worksheet

Do not sell a science project. Sell a control. Every cell below is blank on purpose: **bring your own incident math.** No industry averages, no borrowed percentages.

Step 1. Pick one workflow that already hurts when it is wrong

Step 2. Baseline two weeks by hand

Measure	Your number
Items handled	
Minutes per item	
Errors found later (and what each cost to unwind)	
Loaded hourly rate you will use	

Step 3. Run it gated and count from the log

Gate outcome (from the audit log)	Count per month
Passed and sent	
Refused or blocked (and why)	
Handed back to a named human	
False stops (the human said it was fine)	
Median minutes until a human answered	

Step 4. Price both sides

Line	Value
A. Cost of one bad send to unwind	$
B. Bad sends the gate caught per month	
C. Cost of one false stop (minutes x rate)	$
D. False stops per month	
Gate value per month = (A x B) minus (C x D)	$

Step 5. Report gate outcomes, not just model accuracy

Report passed, refused, handed back, and time to a human answer. If reviewers rewrite most drafts, the log will show it: narrow the use case, do not remove the reviewer.
